

## 2022 ACPA Chairman's Safety Award Finalist: Rinker Orlando – Belt Raise Tool

Every time we replace a return roller, the conveyor belt needs to be raised about one inch off the roller to have enough clearance. Since the belt is so long and heavy, we had to raise the belt with chain hoist to get that clearance. We fabricated a device with angle steel and all-threads to hold and raise the belt up enough to clear the roller off the bracket.
